

## **ABSTRACT**

Packaging for medical devices that impart anti-microbial properties to the surfaces of a medical device is disclosed. In one embodiment, a first compartment stores a medical device and a second compartment stores an anti-microbial agent. When the medical device is ready to be used, the anti-microbial agent from the second compartment flows into the first compartment to impart anti-microbial properties to the surface of the medical device. In another embodiment, components of the package are treated with an anti-microbial agent, which are then transferred or imparted to the surfaces of a medical device stored within the package.
